# Business Analyst Task – 0 1

Step -1

Below screen shot refers after I login to my Github account and click on the star

Github_star_Screenshot.png

Step -2

What problem does sparrow solve ?

First of all we need to talk about the Sparrow. Sparrow is the AI buddy which is used to test and debug and give us persistent output

i)buddy is used to solve all type of errors either it may be a analytical errors, REST API's errors , server side etc

ii)it may solve complex multitasking problems at a time.

==Best example as my assumption== - for Sparrow buddy is equal to Aws cloud watch .

Why I given cloud watch as a example for a Sparrow buddy because it is also monitor the all the data and given notifications to us

2) Who are Sparrow competitors ?

Generally competitors are I know there are always used to perform some tasks

i)**Asana** is the one the competitors which is used to perform tasks

ii**) slack** is the other competitors which have used task coordination

iii)**Notion** is the work space of the databases

3) where could sparrow position it self better ?

==I observed that== : when buddy is performed the **task management** or **multitasking** get better position

ii)When we are giving input evidently then also buddy It self better

==Best example as my assumption== : When employees are working in the start up company buddy gets perform better multi-tasking

Conclusion :

First of all a very special thank you to **Techdome solutions private limited** for giving a wonderful task to me

On this task I observed that how the AI buddy(sparrow) work in a different condition .
